Digital Literacy Essentials

Introductory study guide · Prepared as sample educational content for the StudentHub frontend project.

1. Evaluate online information

Check who published a claim, when it was published, what evidence supports it, and whether independent sources agree. Distinguish facts, opinions, advertising, and unsupported claims.

2. Search with purpose

Use specific keywords, quotation marks for exact phrases, and site or file filters when useful. Read beyond the search snippet and record source details while researching.

3. Protect accounts

Use long, unique passwords and a password manager where appropriate. Enable multi-factor authentication. Be cautious with unexpected links, attachments, and requests for personal information.

4. Privacy and permissions

Share only information needed for a task. Review app permissions and privacy settings. Remember that screenshots, shared documents, and public posts can reveal more context than intended.

5. Collaborate responsibly

Use clear file names, version history, comments, and agreed responsibilities. Credit sources and contributors. Keep a backup of important academic work.

6. Digital wellbeing

Manage notifications, take screen breaks, and choose tools that support rather than fragment attention. Accessibility settings such as captions, zoom, and text-to-speech can improve the experience.

Checklist

Before trusting a source, check its author, evidence, date, and purpose. Before sharing data, ask whether the recipient needs it and whether the channel is appropriate.
