Study Skills That Stick

Introductory study guide · Prepared as sample educational content for the StudentHub frontend project.

1. Plan a useful session

Begin with a specific outcome, such as summarising one lecture or completing four practice problems. Break broad tasks into actions that can be started without further planning.

2. Active recall

Close your notes and retrieve the main ideas from memory. Use questions, flashcards, blank-page summaries, or practice problems. Check your answers and correct misunderstandings.

3. Spaced practice

Review material over increasing intervals instead of cramming everything into one sitting. Short, repeated retrieval sessions help you notice what is becoming secure and what needs attention.

4. Effective notes

Capture key claims, definitions, examples, and questions rather than copying every word. After class, organise the material and write a short summary in your own language.

5. Manage attention

Choose one task for a focused block. Silence non-essential notifications, keep needed materials nearby, and take short breaks. If concentration is difficult, reduce the task to a smaller first step.

6. Prepare for exams

Start with the learning outcomes and practise questions. Track errors by topic and reason. Ask for clarification early, protect sleep, and avoid relying only on rereading.

Weekly reflection

What did I understand well? What remains unclear? Which study action helped most? What is one realistic adjustment for next week?
